

# Presorted Trim Bundles Save Installers Time

Time is money, and Winco is launching a new initiative, Trim Kitting, to help installers get the job done quickly and efficiently. Most of the trim will now be presorted and bundled together according to opening type. Trim Kitting will be a huge time-saver for installers in the field, especially for complicated trim and accessory orders. Instead of spending time shaking out a load of materials, the installer will have smaller, presorted bundles. Easy to find; easy to manage. Let us do the upfront work and simplify the time spent at the jobsite.

Here's how it works: Instead of parts spread over many bundles with other pieces from different marks, Winco will presort parts in a Trim Kitting bundle that includes just one head receptor, one sill receptor, two jamb receptors, two mullions and mullion covers, and three receptor snap closures. Mull clips, screws, and tapes will continue to be bulk-packaged in separate containers.
